According to KDB 447498 section 4.3.1, the 1-g SAR test exclusion thresholds at test separation distance ≤ 50 mm are determined by:

[(max. power of channel, including tune-up tolerance, mW) / (min. test separation distance, mm)] $*\cdot[\sqrt{f(GHz)}] \le 3.0$

Report No.: T160621S02-RP1-1

The tune-up power is 0 dBm +/- 2dB, therefore the highest tune-up power is 1.2 dBm (1.31 mW) @ 2440 MHz

When the minimum *test separation distance* is < 5 mm, a distance of 5 mm according to 5) in section 4.1 is applied to determine SAR test exclusion.

So, (1mW / 5mm) * (2.440GHz ^0.5)= 0.4

[(max. power of channel, including tune-up tolerance, mW) / (min. test separation distance, mm)] * $[\sqrt{f(GHz)}] = 0.4 < 3.0$

Therefore, standalone SAR measurements are not required for both head and body.
